

'Zorg-online' is Dutch for: 'Care-online'

We proudly present to you the most advanced solution to deliver remote care via internet ever conceived. We successfully apply a safe and secure audiovisual connection with the possibility of co-browsing and follow-me technology, in conjunction with a webbased client-dossier from a different source.

Herewith you can deliver care to the chronically ill with great efficiency. After you meet with your client via internet you can take over the control of the software at both ends of the connection (follow-me) and simultaneously browse together to the web based dossier of the client (co-browsing) via a direct link that has been created through a single-sign-on mechanism. Meanwhile you stay connected with your webcam and microphone.

The web-based dossier is updated in advance by the client or his caregiver as part of the preparation for the consultation and contains actualized information about his or her condition by means of validated questionnaires. The results are represented by colourful graphs which serve as the basis for the conversation. At the end you can schedule a new appointment in the agenda and complete a summary in the dossier. Moreover, you can also record a video during your contact for further reference. You can also exchange secure emails within the dossier.

This way you and your client efficiently work together and the information is stored

It is currently in use for 12 months by Nieuw-Unicum an organization specialized a.o. in the care of persons with chronic Multiple Sclerosis (MS) (visit: www.ms-op-afstand.nl). A vast majority of the clients with MS is satisfied with the quality of this care via internet.

It can also be applied to other disease areas, such as diabetes, heart failure and COPD or for the monitoring of the fragile elderly. In that case you can also monitor laboratory results and measurements of physical variables such as heart rate, bloodpressure and bodyweight depending on the disease you want to monitor. If you have already a webbased dossier available from your own source, it is very probable that it can be used in this setting too.
